

Upon signing in for the first time a user will be asked if we can use their location. This will be used to attach a map to a receipt.

Need to determine when to prompt non-Payments by Wave users to sign up with Stripe - when accepting their first credit card payment or as soon as they get into the app.

Welcome views (see bottom of doc) - need to get users to set the default account and category. Might be too risky to set defaults for them! If we force selection, we might want to trigger the connection to Stripe first, thus removing the need to ask them to select a payment account (since it's already set in the Stripe setup flow).

Photos will not be displayed within Wave initially but we can use them in the receipt.

**Sales taxes**  
 Enables users to select sales taxes to apply to payments by default  
 - Enables users to add new sales taxes

**Categories**  
 Enables users to set a default category for their payments  
 - Ideally, we will create a new default category of Mobile payments (We'd need an endpoint to create this category)

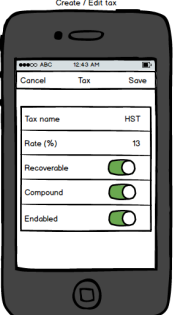

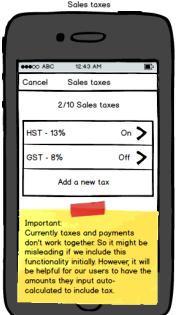

**Accounts**  
 Enables users to set a default payment account  
 - If the user is a Payments by Wave user, this account will already be set so we have to prepopulate it correctly  
 - Need to determine what the best account to set as a smart default

If the user does not have a Stripe token associated with their Wave account, they're asked to connect to or create their Stripe account.

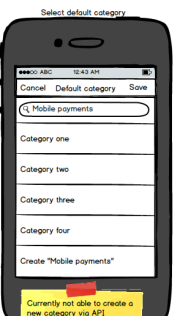

This will occur after they select Credit card as the payment type.

Future improvement - create a native Stripe sign up view which passes as many values as possible to Stripe's webview

Need to enable users to re-send the receipt

Important: Currently taxes and payments don't work together. So it might be misleading if we include this functionality initially. However, it will be helpful for our users to have the amounts they input auto-calculated to include tax.

Only create the Mobile payments category if the user selects Save without selecting another category

Currently not able to create a new category via API

If the user is an existing Payments by Wave user (i.e. they've connected to Stripe already) this account will be already set. So we need to populate it correctly and update the copy to reflect that we recognize that they've already selected it. Otherwise, they'll have to select one of their existing accounts unless we expose another endpoint to create a new one.

Currently not able to create a new payment account via API
